

ABSTRACT:

A method and system is disclosed for processing information provided from various content providers in the form objects having states subject to periodic updates. Formatted information indicating a current state of the objects are delivered to subscribing clients in substantially real-time. An information manager module is configured to receiving raw data objects from the content providers, format the information, and broadcast current state information on various broadcast data stream. A client manager module supports multiple client communication sessions and connects to at least one broadcast data stream. Current state information received on a broadcast data stream is processed and transmitted to specific clients in accordance with processing rules specified in the client profiles.
